13. ABSTRACT (Maximum 200 words)

In this sixth annual legislatively mandated report, 1994 and 1995 DUI data from several diverse sources were compiled and cross-referenced for the purpose of developing a single comprehensive DUI data and monitoring system. This report presents crosstabulated information on DUI arrests, convictions, court sanctions, administrative actions and alcohol-involved accidents. In addition, this report provides an evaluation of the effectiveness of alternative court and administrative sanctions (including alcohol treatment programs and license actions) upon the postconviction records of first and second DUI offenders. The postconviction driving records of DUI offenders arrested in 1989, 1992, and 1994 were evaluated for six-, three-, and one-year periods, respectively.

Postconviction susp/rev	76541	78006	78156	79022	90237	91155	100858	79609	68441	59600	52462
Alcohol-involved fatalities	2412	2543	2754	2510	2509	2382	2048	1832	1569	1488	1343
% of total fatalities	48.9	48.7	50.1	46.6	46.6	46.0	44.1	43.8	37.7	35.3	32.2
Alcohol-involved injuries	66667	69876	68816	65033	63937	63847	55779	48969	42936	39437	36961
% of total injuries	20.7	20.1	19.1	18.2	17.6	17.5	15.9	14.5	13.6	12.5	12.1

[1]These totals were reported by the Department of Justice, Law Enforcement Information Center, and include a small number of duplicates (0.9% in 1995).

[2]These data represent a DMV master file count of the number of DUI abstracts received (by year of violation), minus duplicates. These totals do not include conviction abstracts not yet received. Thus, for the most recent years, these figures will substantially underestimate the final conviction totals.

[3]These data include a projected number of abstracts not yet received. This number is based on an empirically derived function of the court abstract reporting rate.

[4]These totals were taken from the DMV annual Suspension and Revocation reports and include late reporting of convictions from prior years.

[5]Since 1991, total mandatory suspension/revocation exceeds the number of DUI arrests because many offenders now receive both an APS and postconviction suspension/revocation.

[r]Revised from prior reports.

[r]Revised from prior reports.

HIGHLIGHTS OF 1997 CALIFORNIA DUI-MIS REPORT

- Alcohol-involved traffic fatalities continued to decrease substantially in 1995 (-9.7%), and have dropped by over half since 1987 (-51% overall).

- The decline in DUI arrests which began in 1991 continued through 1995, although at a much slower rate (-3.7%) than in previous years. FY 95/96 administrative per se (APS) actions increased by 10.7%, however, possibly indicating that the recent trend in declining DUI arrests may have reversed during 1996. DUI arrests have fallen 45% since 1990.

- The number of persons injured in alcohol-involved accidents during 1995 declined (-6.3%) for the ninth consecutive year, resulting in a 46.3% reduction in alcohol-involved injuries over the 9-year time period.

- 13.2% of all 1994 DUI arrests were associated with a reported traffic accident, compared to 13.1% in 1993 and 11.1% in 1991 and 1992. Almost half (49.5%) of these accidents involved an injury or fatality.

- The average blood alcohol concentration (BAC) of a convicted DUI offender, as reported by law enforcement on APS forms, was .168% in 1994, which is more than double the California illegal per se BAC limit of .08%. The average BAC reported on 1994 DUI abstracts of conviction was 0.166%, the same as in each of the prior three years.

- Requests for APS hearings declined 27% in FY 95/96 (from 11.8% to only 8.6% of all APS actions), reversing a trend of increasing hearing requests each year since APS was implemented in FY 90/91. The rate at which APS suspension/revocation actions are upheld after hearing continued to decline, however, dropping from 87% in FY 90/91 to 68% in 94/95.

- Among 1995 DUI arrestees, Hispanics (45.5%) again constituted the largest racial/ethnic group, and were arrested at a rate that is almost twice that of their percentage of California's adult population (26%).

- The average age of a DUI offender in 1995 was 33.3 years. Less than 1% of arrested DUI offenders are juveniles (under age 18).

- Among convicted DUI offenders in 1994, 68.8% were first offenders and 31.2% were repeat offenders (one or more prior convictions within the previous 7 years). The proportion of repeat offenders has decreased slightly each year since 1989, when it stood at 37%.

- 18.0% of 1994 DUI arrest cases did not show any corresponding conviction on DMV records. This rate is down slightly from 18.8% in 1993 and 19.2% in 1992. This reduction could reflect system improvements initiated by the department to improve the effectiveness of DUI adjudication and to increase the reporting of DUI convictions.

- Alcohol treatment, in conjunction with license restriction, was the most effective postconviction sanction in reducing subsequent DUI incidents among DUI offenders, by a minimum of 12.6% over other sanction alternatives (1989-1994).

- License suspension was the most effective postconviction sanction in reducing subsequent accidents for first offenders, producing reductions of at least 13.3% across the years (1989-1994). With the imposition of preconviction APS suspensions, beginning in July 1990, the postconviction total accident rates of all sanction groups were reduced. Because all DUI offenders were now suspended under the APS law, the incremental impact of postconviction suspension actions became less distinct.

- Jail, in the absence of treatment or postconviction suspension, was the least effective sanction for first offenders in terms of DUI recidivism; offenders sentenced to jail had up to 19.8% more DUI incidents than the second least effective sanction.

- Statewide, 4.6% of 1994 DUI offenders were required to install an ignition interlock device in combination with attending SB 38 alcohol treatment programs. Although there is a positive trend, there is no evidence, as of yet, that ignition interlock increases the incremental effectiveness of other DUI sanctions.

ACKNOWLEDGMENTS

The authors acknowledge with appreciation the many individuals who have contributed to the success of this project. In particular, we wish to acknowledge the cooperation of the Department of Justice, Statistical Analysis Center, in providing annual DUI arrest data and documentation. The contributions of Debbie McKenzie, Associate Government Program Analyst, in transforming mainframe computer files into readable data tables and figures, as well as her general assistance in the production of this report, are acknowledged with appreciation. We also would like to acknowledge the contributions of Patrice Rogers, Research Analyst II, Pat Timmons, Staff Programmer Analyst, and the administrative direction and report review efforts of Raymond C. Peck, Chief, Research and Development Branch.

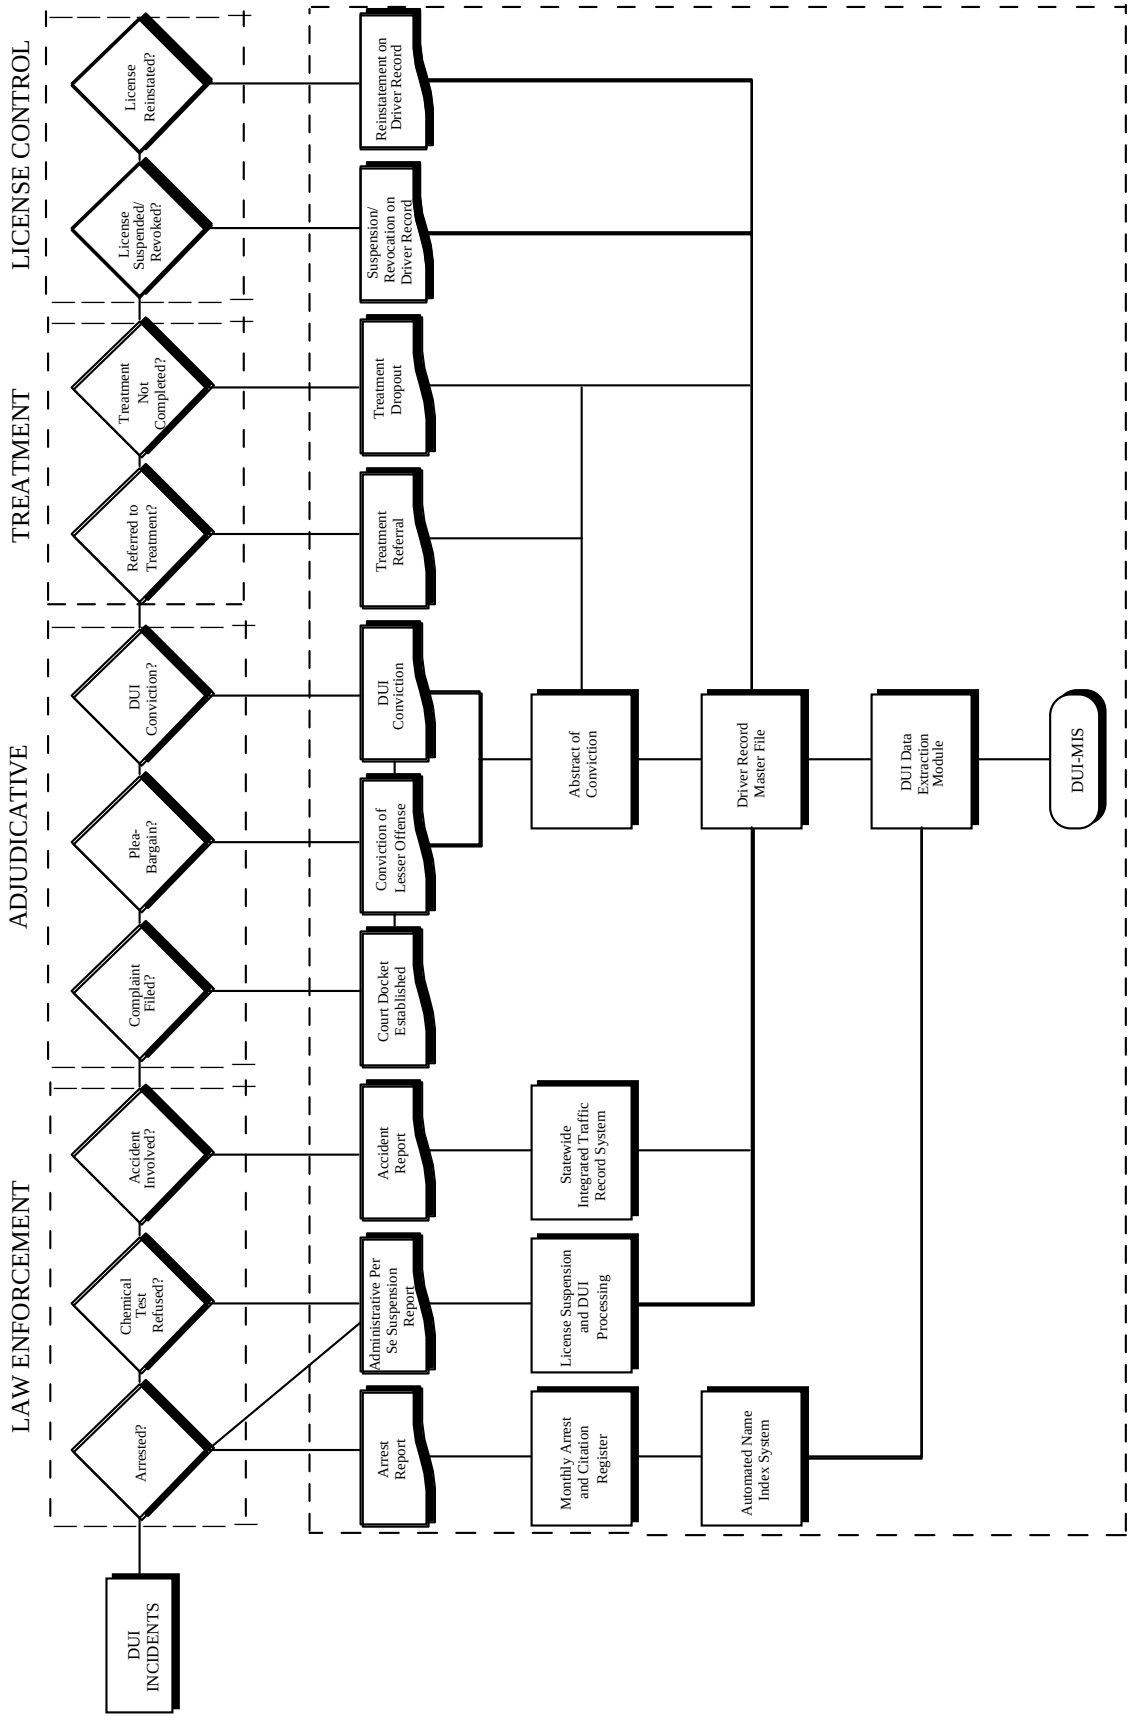
INTRODUCTION

This report is the sixth Annual Report of the California DUI Management Information System, produced in response to Assembly Bill 757 (Friedman), Chapter 450, 1989 legislative session (see Appendix A). This bill required the Department of Motor Vehicles (DMV) to "establish and maintain a data and monitoring system to evaluate the efficacy of intervention programs for persons convicted" of DUI in order to provide "accurate and up-to-date comprehensive statistics" to enhance "the ability of the Legislature to make informed and timely policy decisions." The need for such a data system had long been documented by numerous authorities, including the 1983 Presidential Commission on Drunk Driving. In responding to this legislative mandate, this report combines and cross-references DUI data from diverse sources and presents them in a single reference. Data sources drawn upon include the California Highway Patrol (CHP) for accident data, Department of Justice (DOJ) for arrest data, and the DMV driver record database. Each of these reporting agencies, however, initially draw their data from diffuse primary sources such as individual law enforcement agencies (arrest and accident reports) and the courts (abstracts of conviction).

The general conceptual design of the California DUI management information system (DUI-MIS) is presented in Figure 1. The basic theme of the DUI-MIS is to track the processing of offenders through the DUI system from the point of arrest and to identify the frequency with which offenders flow through each branch of the system process (from law enforcement through adjudication to treatment and license control actions). Figure 1 also illustrates the relationship between offender flow and data collection at each point of the process. The initiating data source for the DUI-MIS is the DUI arrest report, as compiled by the DOJ Law Enforcement Information Center's Monthly Arrest and Citation Register (MACR) system.

Another major objective of this report is to evaluate the effectiveness of court and administrative sanctions on convicted DUI offenders. This is accomplished by examining the postconviction recidivism records (alcohol/drug-related accidents and traffic convictions) of offenders assigned to alternative sanctions, as detailed in the section on "Postconviction Sanction Effectiveness."

Figure 1. DUI management information system.



It should again be noted that it is not an objective of this report to interpret, analyze or make recommendations based on the data presented. Rather, the primary purpose of a reporting system such as the DUI-MIS is to provide objective data on the operating and performance characteristics of the system for others to assess in making policy decisions, formulating improvements and conducting more in-depth evaluations.

The DUI-MIS data system and report has led to numerous improvements in the California DUI system, from the identification of inappropriate dismissals in a small central valley court to major initiatives currently underway to improve the tracking and reporting of DUI cases. The success of the California DUI-MIS has also contributed to a national initiative to design a model DUI reporting system, currently being developed under contract to the National Highway Traffic Safety Administration (NHTSA).

SECTION 1: DUI ARRESTS

The information presented below on DUI arrests is based primarily on data collected annually by the Department of Justice (DOJ), Law Enforcement Information Center, Monthly Arrest and Citation Register (MACR) system. These data are the most current nonaggregated data available on DUI arrests.

Table 1: DUI Arrests By County and Annual Percentage Change from 1993-1995. The number of DUI arrests by county for the years 1993-1995 and the percentage changes from 1994 to 1995 are shown in Table 1.

Table 2: 1995 DUI Arrests by County and Type of Arrest. This table shows a breakdown of 1995 DUI arrests by felony, misdemeanor, and juvenile arrest type, by county. This table also shows county and statewide DUI arrest rates per 100 licensed drivers.

Tables 3a-3b: 1995 DUI Arrests by Age, Sex, and Race/Ethnicity. Table 3a crosstabulates age by sex and age by race/ethnicity of 1995 DUI arrestees statewide. The same tabulations by county are found in Appendix Table B1. Table 3b shows the same data crosstabulated by sex and age within race/ethnicity.

Figure 2 below displays the trend in DUI arrests from 1985 to 1995.

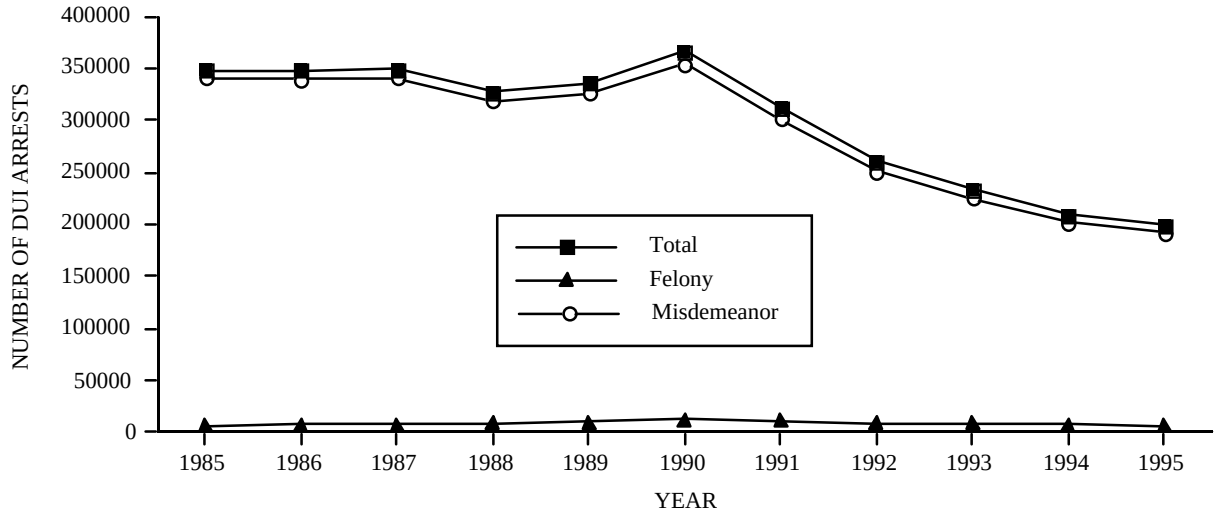


Figure 2 . DUI arrests 1985-1995.

Based on the data shown in Figure 2 and Tables 1, 2, 3a, and 3b, the following statements can be made about DUI arrests in California:

Statewide Parameters:

- DUI arrests decreased by only 3.7% in 1995, following declines of 10.8% and 10.3% in 1994 and 1993, respectively. Since 1990, DUI arrests have dropped by 45%.

- The 1995 DUI arrest rate was the same as in 1994, 1.0 arrests per 100 licensed drivers. This compares to rates of 1.1 in 1993, 1.3 in 1992, 1.5 in 1991, and 1.8 in 1990.

- Felony DUI arrests (involving bodily injury or death) constitute a relatively small proportion (3.3% in 1995) of all DUI arrests.

County Variation:

- 25% of all 1995 California DUI arrests occurred in Los Angeles County. Four counties (Los Angeles, Orange, San Diego, and San Bernardino) had over 10,000 DUI arrests each, and accounted for almost half (46%) of all arrests.

- The 1995 county per capita DUI arrest rates ranged from 0.3 to 9.0 DUI arrests per 100 licensed drivers. Eleven counties had rates below 1.0: San Francisco (0.3), Alameda and Contra Costa (0.7), Mariposa and Santa Clara (0.8), and Amador, Marin, Orange, San Mateo, Solano, and Ventura (0.9). Nine counties had rates of 2.0 or higher and, of these, 3 had rates higher than 2.5: Imperial (2.6), Colusa (2.9), and Alpine (9.0). The extremely high rate for Alpine must be viewed with caution because of the extremely small population size of Alpine County (N = 800 licensed drivers in 1995).

- Many counties again showed a decline in DUI arrests in 1995. Among the larger counties, the greatest declines occurred in Alameda (-22.4%), Kern (-17.8%), San Francisco (-15.0%), and Ventura (-13.8%). Among other counties, the largest decreases in DUI arrests occurred in Modoc (-40.9%), Mariposa (-17.9%), and Mono (-17.8%). Among counties showing increases in DUI arrests were Nevada (34.7%), El Dorado (27.8%), San Benito (24.8%), Alpine (22.0%), and Tuolumne (20.0%).

Demographic Characteristics:

- The average age of a DUI arrestee in 1995 was 33.3 years. Roughly half (46.9%) of all arrestees were age 30 or younger and over three-quarters (77.6%) were age 40 or younger. Less than 1% of all DUI arrests involved juveniles (under age 18). 2.3% of all arrestees were over age 60.

- Males comprised 87.8% of all 1995 DUI arrests.

- Among 1995 DUI arrestees, Hispanics (45.5%) continued to be the largest racial/ethnic group, being arrested at a rate substantially higher than their 1995 population parity of 26.0% (Department of Finance, Demographic Research and Census Data Center). All other racial/ethnic groups were underrepresented among DUI arrestees, relative to their estimated 1995 population parity: Blacks (6.3% of arrests, 6.7% of the population), Whites (42.8% of arrests, 56.7% of the population), and Other (5.4% of arrests, an estimated 10.6% of the population). Figure 3 below shows the percentages of 1995 DUI arrests and 1995 estimated census adult population by race/ethnicity.

- Among male 1995 DUI arrestees, 49.1% were Hispanic, 39.2% were White, 6.2% were Black, and 5.4% were "Other." Among female DUI arrestees, 68.8% were White, 19.0% were Hispanic, 7.1% were Black, and 5.1% were "Other."

- In the following 8 counties, Hispanics comprised over 60% of those arrested for DUI during 1995: Tulare (75.6%), Imperial (72.9%), Fresno (71.1%), Madera (71.0%), San Benito (69.4%), Merced (65.9%), Los Angeles (61.3%), and Monterey (60.2%). In most other counties, the majority of arrestees were White.

- The average age of a DUI arrestee varied considerably by race: Blacks were the oldest with a mean age of 35.9 years, while Hispanics were the youngest, with a mean age of 30.9 years.

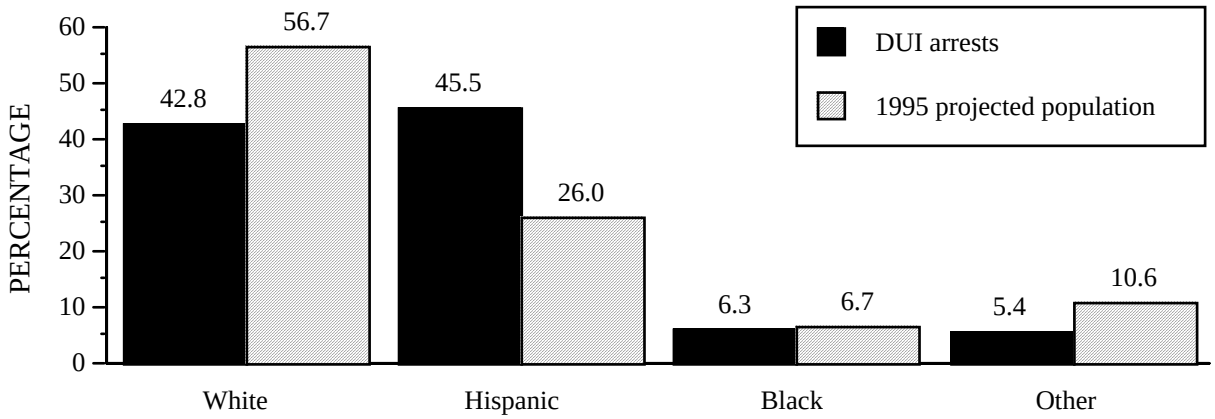

Figure 3 . Percentage of 1995 DUI arrests and 1995 projected population (age 15 and over) by race/ethnicity.

SECTION 2: CONVICTIONS

Data on convictions resulting from court adjudication of DUI arrests are reported directly to the Department of Motor Vehicles (DMV) on court abstracts of conviction. The following tables compile and crosstabulate these conviction data by demographic, geographic, and adjudicative categories.

Table 4: 1994 DUI Convictions by Age and Sex. This table crosstabulates statewide DUI conviction information by age and sex. Corresponding county-specific conviction data are presented in Appendix Table B2.

Table 5: Matchable 1994 DUI Convictions by Age, Race/Ethnicity, and Sex. This table displays DUI conviction information by age, race/ethnicity, and sex. "Matchable" DUI convictions are those which are traceable to a DUI arrest appearing on the MACR system. Because not all arrests could be matched to an existing record, these conviction totals underestimate the total number of actual convictions.

Table 6: Adjusted 1994 DUI Conviction Rates and Relative Likelihood of Conviction, by Age and Race/Ethnicity. This table shows the relative probability of a DUI arrest leading to a DUI conviction, by age and race/ethnicity. DUI conviction totals from categories in Table 5 ("matchable DUI convictions") were increased by the proportion which matchable convictions constituted of "total DUI convictions," shown in Table 7, to arrive at the adjusted DUI conviction rates. Without this adjustment DUI conviction rates would be underestimated using the conviction data from Table 5 because not all reported convictions are "matchable" to an arrest.

Table 7: Total Conviction Data for 1994 DUI Arrestees. This table portrays county and statewide DUI-related conviction data as reported to the DMV on court abstracts of conviction. Corresponding court-specific data are shown in Appendix Table B3. Convictions not reported to DMV are considered nonconvictions for the purposes of this report. Actual nonconvictions include cases where the DUI arrest was not filed, not prosecuted, or resulted in a not guilty verdict. The DUI conviction rates by county were calculated by comparing the county conviction totals with DOJ arrest totals. Because not all 1994 DUI arrests have yet been adjudicated, these conviction totals and rates will slightly underestimate the "final" figures. The DUI conviction rates shown in the "DUI Summary Statistics: 1985-1995" table at the very beginning of this report include an estimate of these late convictions, and thus are slightly higher than those shown in

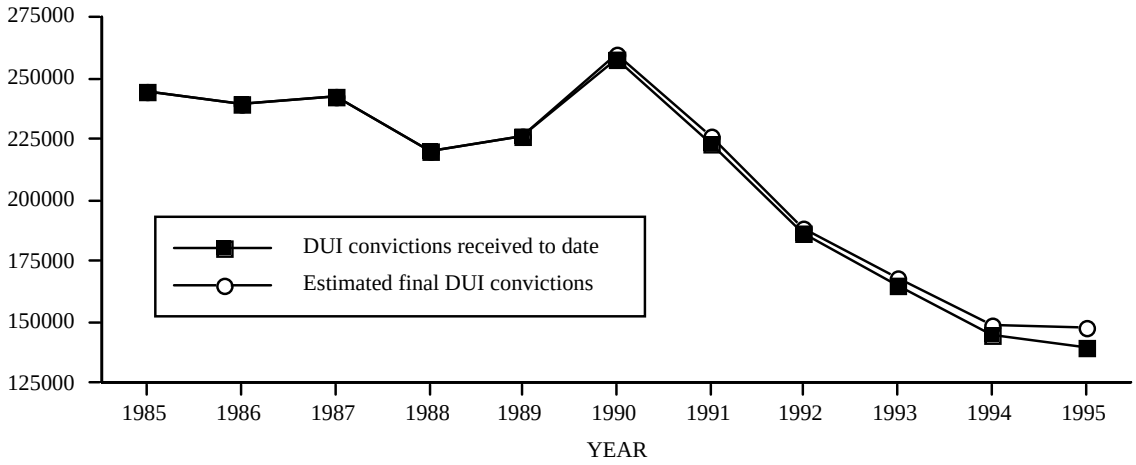
Tables 7 and 8. Conviction variables include felony and misdemeanor DUI convictions, alcohol- and nonalcohol-related reckless driving convictions, convictions of "other" lesser offenses, and DUI convictions dismissed or found unconstitutional. DUI arrest dates from the DOJ MACR system were matched to driver record violation dates to identify nonalcohol-related reckless driving and "other" convictions. The average (mean) adjudication time lags from DUI arrest to conviction, and from conviction to update on the DMV database, were calculated for each county.

Table 8: Adjudication Status of 1994 DUI Arrests by County. This table shows the adjudication status (court disposition) of 1994 DUI arrests, by county. Included are the percentages of arrests which have resulted in DUI convictions (misdemeanor or felony), reckless driving convictions (alcohol-related or nonalcohol-related), convictions of "other" offenses, or no reported conviction, as of the date of writing. Again, because not all 1994 DUI arrests have yet been adjudicated, these rates will slightly underestimate the "final" rate for each category, excepting the category "no record of any conviction," which will be slightly reduced (approximately 1-2%) by the eventual adjudication of these few late cases.

Table 9: 1994 Reported Blood Alcohol Concentration (BAC) Levels of DUI Convictions. This table shows the frequency of reported positive BAC levels for DUI convictions. Because of more complete reporting of BAC levels on APS reporting forms (73%), those reports are used (beginning with last year's report) to calculate statewide BAC levels. Abstracts of conviction, which were used in prior evaluations, report BAC levels in only 51% of cases. However, the two sources yield almost identical estimates of BAC levels.

Table 10: 1994 DUI Convictions by Offender Status and Average Reported BAC Level. This table displays the proportions of convicted DUI offenders by offender status (number of prior convictions), and the average (mean) BAC level from APS reporting forms and abstracts of conviction, for each offense level.

Figure 4 (below) shows, for the years 1985 to 1995, the number of DUI abstracts received to date by DMV from the courts, the estimated final number of DUI convictions which will ultimately be received, and the estimated final DUI conviction rate.



Estimated final conviction rate	70%	69%	69%	67%	67%	70%	72%	72%	72%	72%	73%

Note. Estimated DUI convictions = see footnote 3 to "DUI Summary Statistics: 1985-1995."

Figure 4. DUI abstracts received by DMV and DUI conviction volume and rate estimates, 1985-1995.

Based on these data, the following statements can be made:

Statewide Adjudication Parameters:

- The estimated DUI conviction rate for 1995 (73%) is slightly higher than the estimated conviction rate of each of the previous 4 years (all at 72%).

- Among 1994 DUI arrests, 70.6% have resulted to date in DUI convictions (felony or misdemeanor). This is slightly higher than the corresponding DUI conviction rate for 1993 arrests (70.0%), as reported last year.

- 8.9% of 1994 DUI arrests resulted in reckless driving convictions, with 18% of these not correctly reported as alcohol-related. Both of these rates are similar to the corresponding 1993 rates.

- 2.4% of 1994 DUI arrests have resulted in convictions of offenses other than DUI or reckless driving, the same rate as for 1993 DUI arrests.

- 18.0% of 1994 DUI arrests have not yet resulted in any conviction on DMV's records, compared to 18.8% in 1993 and 19.2% in 1992. As additional cases are adjudicated and reported by the courts, this figure will decrease slightly.

- The average reported BAC level for all convicted DUI offenders in 1994, using APS reporting forms as the data source, was 0.168%, very slightly down from the 1993 level of 0.169%, yet still more than double the illegal per se BAC limit of 0.08%. The average BAC level of these offenders, using court abstracts of conviction as the data source, was 0.166%, the same as for 1993 and 1992 offenders.

- Average BAC levels increase slightly as a function of the number of prior DUI convictions, from 0.164% BAC for a first offense to 0.187% BAC for a fourth or subsequent offense.

- Among 1994 convicted DUI offenders, 68.8% were first offenders, 21.7% were second offenders, 6.8% were third offenders, and 2.7% were on their fourth or more offense. (The statutorily defined time period for counting priors in California is seven years.) The proportion of repeat offenders (31.2%) among all convicted DUI offenders has decreased slightly each year since 1989 (at which time 37% of all convictions were repeat offenses).

- The average adjudication time lags were 2.8 months from DUI arrest to conviction and 3.2 months from conviction to update on the DMV database, totalling 6.0 months from arrest to update on the offender's driving record. These time lags have increased slightly in each of the last two years.

<u>Variation by County:</u>

- Among the larger counties, 1994 DUI conviction rates varied from a high of 87.4% in Ventura to lows of 56.5% in San Bernardino and 56.9% in Fresno. Los Angeles County, which accounted for almost 25% of all DUI arrests in the state, had a DUI conviction rate of 68.4%.

- Among the smaller counties, 1994 DUI conviction rates varied from highs of 87.7% in Nevada and 87.4% in Amador, to a low of 42.0% in Trinity.

- The rates at which DUI arrests were plea-bargained to alcohol-related reckless driving convictions varied from 19.3% in Humboldt County to 0% in Marin and Ventura counties.

- The percentage of DUI arrests that were improperly adjudicated as nonalcohol-related reckless driving convictions varied from 0% to 6.6%. Three counties had rates of 4% or more: Imperial, Calaveras, and San Francisco.

- The percentage of DUI arrests adjudicated as minor convictions ("other" convictions) varied from 0% to 5.7%. San Luis Obispo, Marin, Los Angeles, Calaveras, and Del Norte counties had rates of 4% or more.

- In seven counties, the proportion of arrestees not showing a conviction of any offense exceeded 30%. These counties were Trinity, Sutter, Fresno, Yolo, Tulare, San Bernardino, and Imperial. Nine counties had nonconviction rates of less than 10%: Nevada, San Benito, San Mateo, Kern, El Dorado, Napa, San Luis Obispo, Santa Barbara, and Amador.

Variation by Court:

- As was true for prior years, the 1994 superior court time lags were generally longer than municipal court time lags, presumably due to the type of DUI case (felony) being adjudicated.

- Municipal court time lags from arrest to conviction (for courts with more than a handful of reported convictions) varied from a high of 5.0 months in the Fontana (San Bernardino County) court to a low of 1.3 months for the Los Angeles Metro court, which is also the busiest court in the state.

- Statewide, the proportion of reckless driving convictions (alcohol and nonalcohol), relative to DUI convictions, was about 11% in 1994. Among the courts which substantially exceeded this statewide average were Malibu and Sacramento, which adjudicated 33% and 22% of their DUI cases, respectively as reckless driving.

- Statewide, 18% of all DUI-related reckless driving convictions are designated as nonalcohol. In Riverside County, however, the Superior Court reported 98% (145 out of 147) of its DUI-related reckless driving convictions as nonalcohol.

Demographic Characteristics:

- The average age of a convicted DUI offender in 1994 was 33.9 years.

- 44.2% of 1994 DUI convictees were aged 30 years or younger and 76.4% were 40 years or younger.

- Females comprised 12.2% of all 1994 convicted DUI offenders, compared to 12.3% in 1993, 12.1% in 1992, 12.2% in 1991, 11.7% in 1990, and 11.4% in 1989.

- The racial/ethnic distribution of 1994 DUI convictions (White = 43.3%; Hispanic = 45.1%; Black = 6.5%; Other = 5.1%) generally paralleled that of 1994 arrests, although Whites were somewhat more likely, and other groups somewhat less likely, to be convicted of the offense (as shown in Figure 5 below).

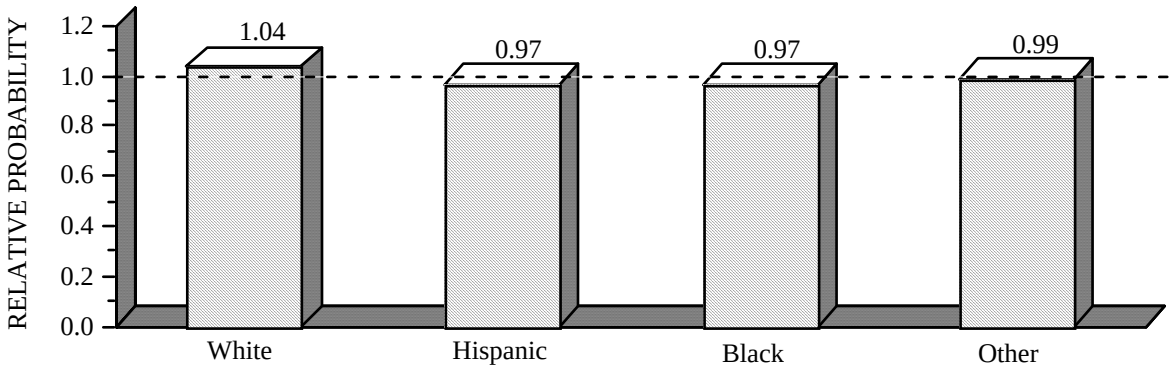


Figure 5 . Relative likelihood of conviction by race/ethnicity. (Adjusted conviction rate by ethnicity ÷ overall conviction rate.)

TOTAL	106782	100.0	TOTAL	10792	100.0
	MEAN BAC .168			MEAN BAC .098	

*The source of BAC data is the APS reporting form for convicted DUI offenders, rather than the abstract of conviction for those offenders, which was the data source in prior reports. This change in data source was made because of the more complete BAC reporting on APS forms (73% of total) versus court abstracts (with only 51% showing BAC levels).

TABLE 10: 1994 DUI CONVICTIONS BY OFFENDER STATUS AND AVERAGE REPORTED BAC LEVEL

DUI OFFENDER STATUS	PERCENT	AVERAGE BAC LEVEL FROM APS REPORTING FORM (%)	AVERAGE BAC LEVEL FROM CONVICTION ABSTRACT (%)
STATEWIDE	100.0	.168	.166
1ST DUI	68.8	.164	.163
2ND DUI	21.7	.175	.174
3RD DUI	6.8	.181	.181
4TH+ DUI	2.7	.187	.185

SECTION 3: POSTCONVICTION SANCTIONS

Data on court sanctions assigned to convicted DUI offenders were taken from DUI abstracts of conviction for offenders arrested in 1994. Also included are counts of postconviction DMV license actions for selected offender groups, while total counts of all license actions, including administrative per se (APS) license suspensions and revocations, are shown in the Administrative Actions Section. APS actions (effective July 1990) are initiated by law enforcement immediately upon arrest for DUI, and are administered independent of the criminal adjudication process. This section includes the following tables:

Table 11: 1994 DUI Court Sanctions by DUI Offender Status. This table shows the frequency of specific court sanctions statewide by number of prior DUI convictions. The specific court sanctions tallied include percentages of probation, jail, alcohol treatment programs (first offender, SB 38 second offender, and 30-month third offender programs), license restriction, court suspension, and ignition interlock. Crosstabulations of sanctions by county, court, and number of prior convictions appear in Appendix Table B4.

Table 12: 1994 DUI Sanction Combinations by County - First Offenders. This table displays the frequency of commonly assigned court sanction combinations (such as first offender alcohol program plus license restriction) by county for first DUI offenders. License suspensions include both court and DMV postconviction (non-APS) suspensions. The sanction combination groups portrayed in this table, as well as Table 13, were defined according to the conventions described in the "Evaluation Methods and Results" portion of Section 4: "Postconviction Sanction Effectiveness."

Table 13: 1994 DUI Sanction Combinations by County - Repeat Offenders. This table shows the frequency of commonly assigned court sanction combinations by county for second, third, and fourth (or subsequent) DUI offenders. License actions include both court and DMV postconviction (non-APS) license suspensions and revocations.

From the data in these and the Appendix tables, it is evident that the use of alternative sanctions continued to vary widely by county, court, and offender status in 1994. For example:

Statewide Parameters:

- The most frequently applied court sanction among all convicted DUI offenders was probation (96.1%), while the least frequently used court sanction was ignition interlock (4.6%). DUI offenders were sentenced to jail in 77.6% of the cases. (However, in many jurisdictions, jail is often served as community service rather than actual jail time.)

Figure 6 (below) graphically displays the statewide data from Table 11 showing the frequency of specific types of court-ordered sanctions among all convicted DUI offenders. Because virtually all offenders receive more than one type of sanction, the cumulative percentage adds to more than 100%.

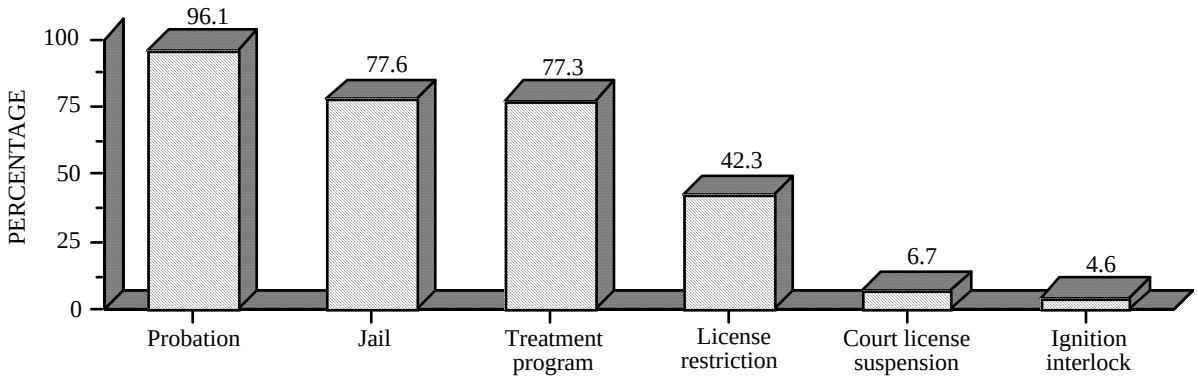

Figure 6 . Frequency of court-ordered DUI sanctions (1994).

County Variation:

- The proportion of first DUI offenders sentenced to jail varied by county from less than 10% in Marin to 100% in Tuolumne.

- Counties such as Calaveras, Lassen, Napa, San Luis Obispo, San Mateo, Shasta, Sierra, and Tuolumne preferred to assign first offenders to treatment program and jail (over 85%) rather than treatment program and license restriction (less than 7%). Humboldt, Marin, Plumas, and San Bernardino counties assigned treatment program and jail to less than 2% of their first offenders. Inyo, Marin, and Orange

counties assigned treatment program and license restriction to over 80% of first offenders.

- Counties departing from using typical first offender sanction combinations were Imperial, Mariposa, Riverside, and San Bernardino, as shown by relatively high percentages (over 10%) in the "other" category. ("Other" includes license restriction without treatment program assignment, probation only, and other unofficial nonstatutory sanction combinations.)

Court Variation:

- In Los Angeles County, two municipal courts (Lancaster and Burbank) used jail as a sanction in 95% or more of their DUI sentences. At the other extreme, three courts (Santa Monica, Malibu, and Avalon) used jail as a sanction in less than a third of their DUI sentences.

- Although courts required about 14% of repeat offenders to install the interlock device statewide, the Oakland court required three-fourths of such offenders to use interlock.

- All of the municipal courts in Contra Costa and Alameda counties required jail in 95% or more of their DUI sentences, while Marin's San Rafael court used jail in only 27.7% of their cases.

- 7 out of 11 municipal courts in Fresno sentenced over 95% of their DUI offenders to jail, while 6 out of 12 municipal courts in San Bernardino county used jail for less than a third of their DUI sentences.

Variation by Offender Status:

- 70% of 1994 first DUI offenders were sentenced to jail, compared to over 90% of all repeat offenders.

- 83% of first DUI offenders were assigned to alcohol treatment programs, along with 78% of second offenders, 42% of third offenders, and 19% of fourth or more DUI offenders. (By statute, however, all repeat offenders must eventually complete

specified alcohol treatment programs in order to be eligible for license reinstatement.)

- 10% of first DUI offenders and 25% of second DUI offenders received DMV or court license suspensions after adjudication. Since July 1990, of course, all DUI offenders with BAC levels of 0.08% or more are also subject to 30 days to one-year administrative license suspension/revocation under the APS law.

- Only 14% of repeat DUI offenders were assigned ignition interlock in 1994, in spite of the mandatory interlock law for all repeat offenders (AB 2851 - Freidman), which took effect on July 1, 1993.

TABLE 11: 1994 DUI COURT SANCTIONS BY DUI OFFENDER STATUS*

DUI OFFENDER STATUS	TOTAL	PROBATION	JAIL	1ST OFFENDER ALCOHOL PROGRAM	SB 38 ALCOHOL PROGRAM	30-MONTH PROGRAM	LICENSE RESTRICTION	COURT SUSPENSION	IGNITION INTERLOCK
		%	%	%	%	%	%	%	%

4TH+ DUI	4007	60.5	94.8	2.5	16.1	0.4	7.0	10.4	3.2

*Entries represent percentages of 1994 DUI convictees receiving each sanction by offender status. Sanctions within each offender status group (row) are not independent; therefore, row percentages always add to more than 100%. Percentages of sanctions by county and court appear in Appendix Table B4.

SECTION 4: POSTCONVICTION SANCTION EFFECTIVENESS

This section presents and describes the results of an evaluation assessing the effectiveness of court and administrative sanctions applied to first and second DUI offenders[1]. The effectiveness of alternative sanctions is evaluated in terms of postconviction driving record as measured by: 1) total accidents and 2) DUI incidents, including alcohol-involved accidents, major convictions (primarily DUI, also reckless driving and hit-and-run), APS (0.08% BAC or chemical test refusal) suspensions and DUI failure-to-appear notices (FTA). Displayed below in Figures 7-15 are failure proportions from the sanction analyses for 1989, 1992, and 1994 first and second offenders (grouped by sanction assignment) with follow-up time periods of 6-years, 3-years, and 1-year, respectively. (The 1990, 1991, and 1993 offenders were not included in this year's report in order to simplify the analyses and reporting of results.) These figures show the proportion of accident- or DUI incident-involved drivers following their conviction. They are followed by a narrative description of the evaluation design, subject selection, data collection, analytical procedures, and evaluation results. The reader is cautioned that license suspension refers to postconviction suspensions only, and does not include preconviction administrative per se license suspensions (which are applied to all offender groups).

Based on the data represented in Figures 7-12, the following conclusions can be drawn about first offender sanctions:

- The 1989, 1992 and 1994 suspended first offender groups had significantly fewer subsequent accident-involved drivers than did any other first offender sanction group. The suspended group had 20%, 13.3% and 18.5% fewer accidents than the group with the next lowest accident rates (program with jail) among drivers convicted in 1989, 1992, and 1994, respectively.

[1]Third or more offenders were not included because a previous study (Tashima & Marelich, 1989) indicated serious confounding due to group differences on prior interventions. In addition, sanctions for third and subsequent offenders do not vary much, due to the statutorily prescribed sanction requirements.

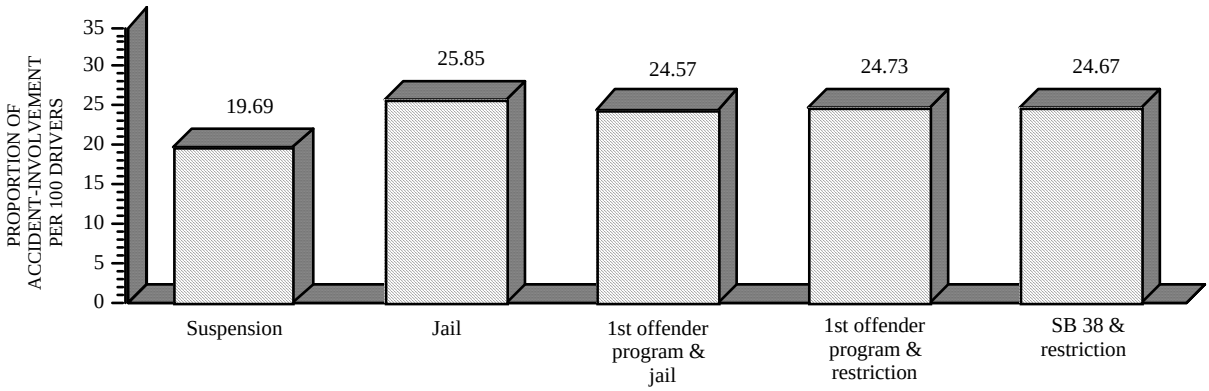

Figure 7 . Adjusted 6-year accident rates of 1989 first offenders by type of sanction.

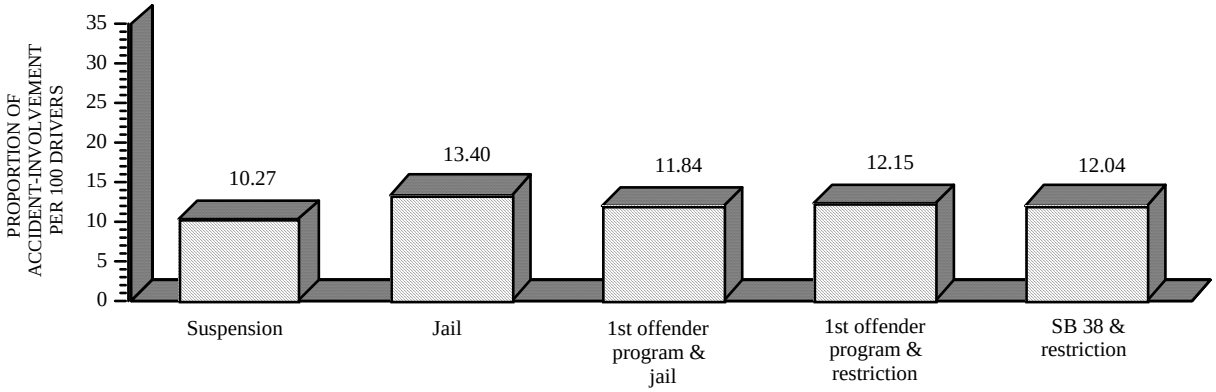

Figure 8 . Adjusted 3-year accident rates of 1992 first offenders by type of sanction.

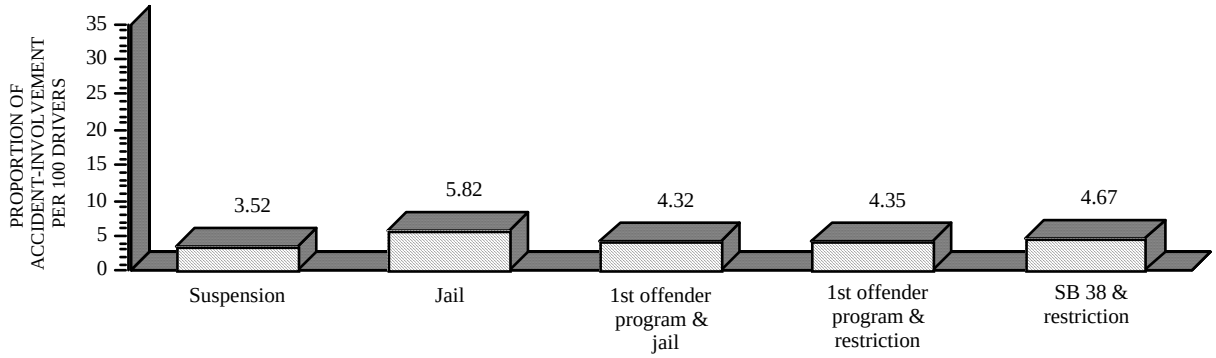

Figure 9 . Adjusted 1-year accident rates of 1994 first offenders by type of sanction.

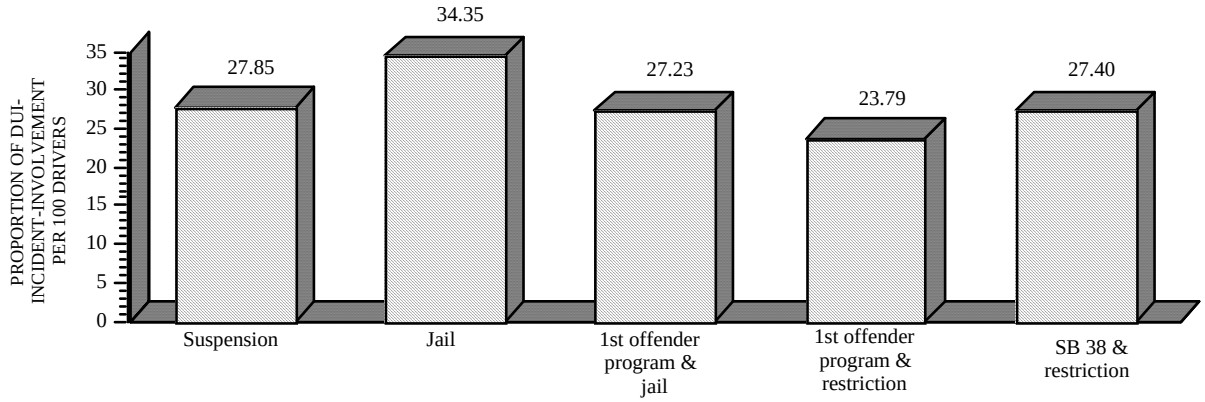

Figure 10 . Adjusted 6-year DUI incident* rates of 1989 first offenders by type of sanction (*alcohol-related accident or violation).

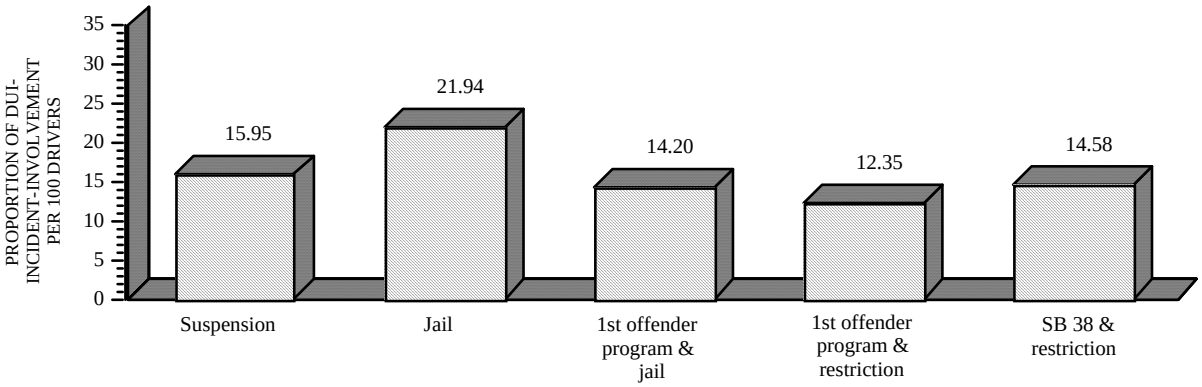

Figure 11 . Adjusted 3-year DUI incident* rates of 1992 first offenders by type of sanction (*alcohol-related accident or violation).

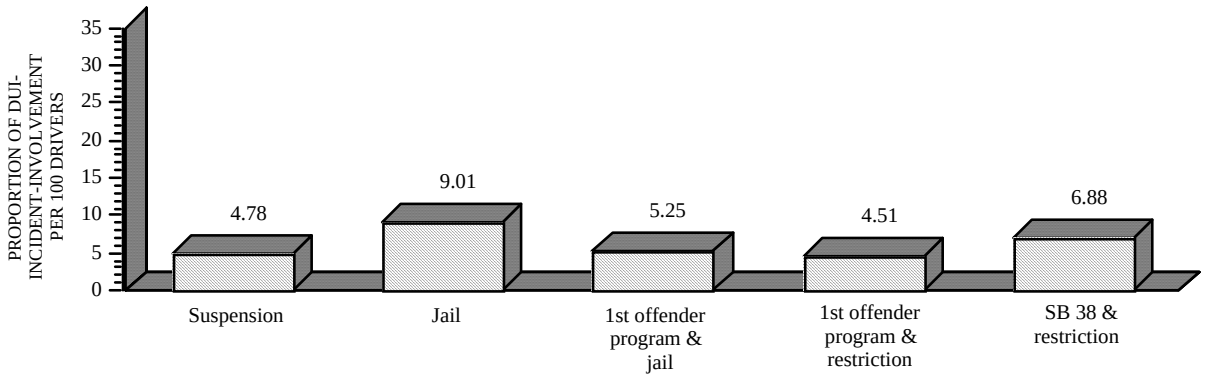

Figure 12 . Adjusted 1-year DUI incident* rates of 1994 first offenders by type of sanction (*alcohol-related accident or violation).

- First offenders assigned to first offender treatment programs plus license restriction in 1989 and 1992 had significantly fewer DUI incidents in the postconviction period than did any other first offender sanction group and, in 1994, had fewer DUI incidents than all groups except the suspended group. The first offender treatment plus license restriction group had 12.6% and 13.1% fewer DUI incidents in 1989 and 1992, respectively, than the group with the next lowest DUI incident rate (program with jail).

- In all three years, first offenders sentenced to jail without treatment or postconviction suspension were significantly more likely to be involved in DUI incidents (at least 5%, 9.3%, and 19.8% higher in 1989, 1992, and 1994, respectively) in the postconviction period than any other first offender sanction group.

Based on the data represented in Figures 13-15, the following conclusions can be drawn about second offender sanctions:

- The 1989 suspended second offender group had 15.3% fewer accident-involved drivers than did the SB 38 program groups over the 6-year postconviction period.

- Contrary to prior California studies including the first annual DUI-MIS report (1989 offenders), second offenders suspended in 1992 and 1994 do not have significantly lower total accident rates than do those assigned to SB 38 treatment programs during the first year following suspension or SB 38 assignment. This change is likely due to the implementation of administrative per se (APS) license suspensions beginning in July, 1990, whereby all second offenders are suspended for one year.

- Although license suspension and SB 38 treatment programs with APS suspensions are equally effective in their short-term impact on accidents (post 1-year), license suspension is more effective over a longer time window (6 years).

- In 1989, 1992, and 1994, second offenders who were suspended had a significantly higher proportion of DUI incidents in the subsequent 1-year period than did those who received the SB 38 and license restriction sanction. The respective percentage increases associated with the license suspension group for the three years (1989, 1992 & 1994) were 18.1%, 45.0%, and 40.2%.

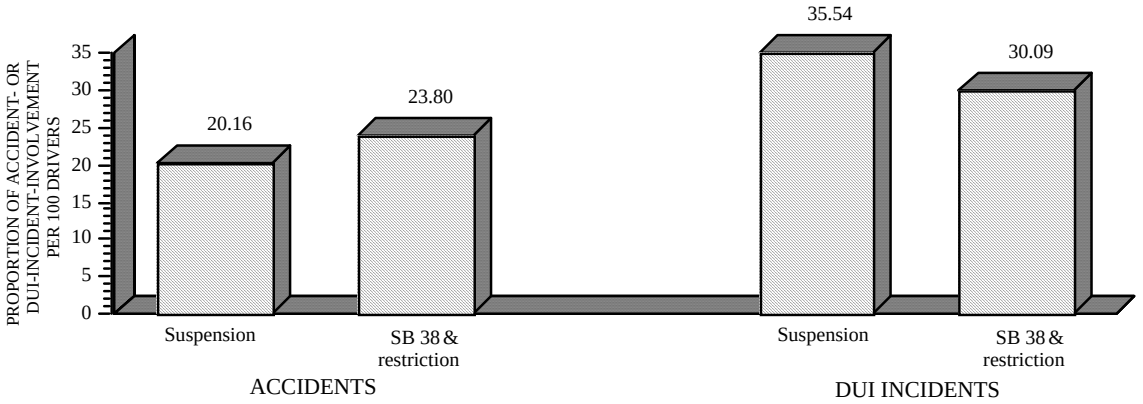

Figure 13 . Adjusted 6-year accident and DUI incident rates of 1989 second offenders by type of sanction.

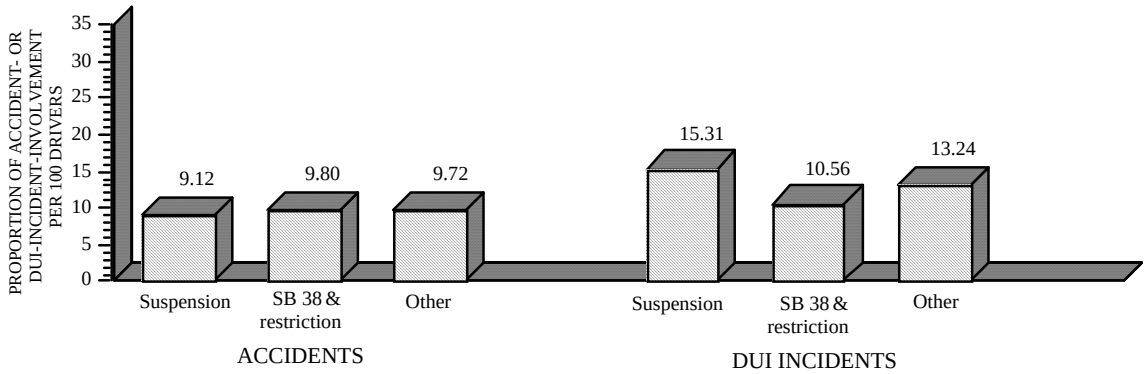

Figure 14 . Adjusted 3-year accident and DUI incident rates of 1992 second offenders by type of sanction.

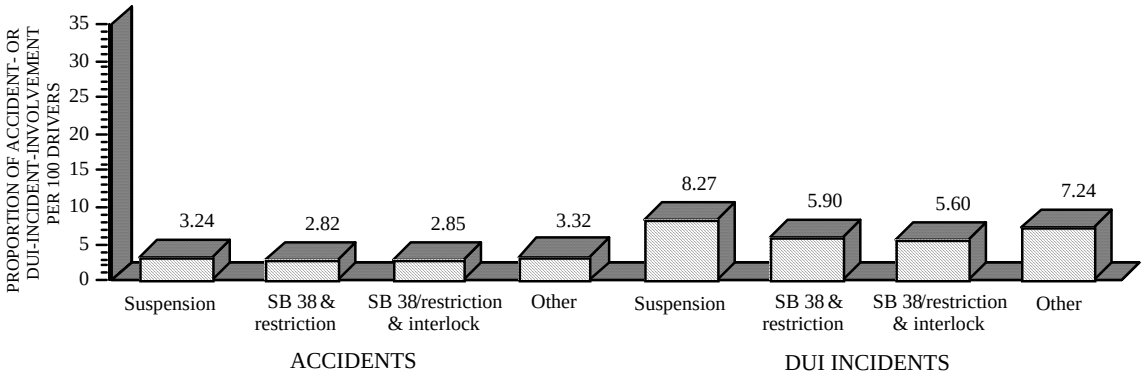

Figure 15 . Adjusted 1-year accident and DUI incident rates of 1994 second offenders by type of sanction.

- The SB 38 program plus restriction sanction for second offenders (with and without the addition of the ignition interlock) had significantly lower 1-year subsequent DUI incident rates than those of the other 1994 sanction groups.

EVALUATION METHODS AND RESULTS

Subject Selection and Data Collection

Convicted DUI offenders were identified from monthly abstract update tapes which contain all DUI conviction data reported to DMV by the courts. In the present study, follow-up data from three sets of offenders were evaluated for sanction effectiveness:

1) A 6-year follow-up period for the convicted 1989 DUI offenders who were evaluated in the first DUI-MIS report.

2) A 3-year follow-up period for convicted 1992 offenders who were evaluated in the 1995 DUI-MIS report.

3) A 1-year follow-up period for convicted DUI offenders who were arrested for DUI in 1994.

For each year's annual DUI-MIS report, an additional year of DUI data is added to the sanction analyses. In order to simplify the analyses and reporting of results, the 1990, 1991, and 1993 DUI offenders were not included in this year's evaluation.

The conviction date in all cases was considered to be the "treatment date" for defining prior and subsequent driving record data, because the penalties and sanctions for the DUI conviction are typically effective as of that date.

Since DUI penalties and sanctions are enhanced as a function of the number of prior DUI and alcohol-related reckless driving convictions within the previous seven years, subjects were selected based on the number of such convictions within the seven years prior to their entry DUI arrest. For the 1989, 1992, and 1994 drivers, two groups were selected for this evaluation: 1) first DUI offenders––drivers who had no DUI or alcohol-related reckless driving convictions within the previous seven years, and 2) second DUI offenders––drivers who had one DUI or alcohol-related reckless driving conviction within the previous seven years. DUI offenders with felony convictions and chemical test refusal suspensions were not included because their license control penalties are more severe than those of the other groups within their respective prior offender group. Also excluded were drivers who did not have a full one-year subsequent time period because of late conviction dates, drivers with “X” license numbers (no California license

number could be found), drivers with out-of-state ZIP Codes and irregular or unofficial sanction codes (first offenders). Altogether, the excluded cases came to 22% of the original convicted offenders.

Court sanctions are reported to and recorded by DMV in the form of disposition codes on the abstract of conviction. A convicted DUI offender, especially a first offender, might receive any one of many combinations of individual sanctions, including jail, fine, license restriction or suspension, alcohol treatment program, or probation. Therefore, in defining postconviction sanction combination groups for the purpose of this analysis, the following conventions were used for first offenders:

1) if suspension (non-APS) was one of the sanctions imposed by DMV or the court, then the offender was included in the suspension group;

2) if suspension (non-APS) was not imposed, but the offender was assigned to an alcohol treatment program, then the offender was included in one of the treatment groups, according to the type of treatment program (first offender or SB 38) and whether they were also sentenced to license restriction or jail; and

3) if neither suspension nor treatment was imposed, but the offender was sentenced to jail, then the offender was included in the jail-only group.

Fine and probation are generally imposed on most DUI offenders (except that probation is not usually granted to court-suspended first offenders), and for that reason are not included as sanctions evaluated in this report. Also, since July, 1990, all DUI offenders have had their licenses administratively suspended upon DUI arrest.

It should be noted that the definition of the sanction combination groups was not an arbitrary analytical convention, but rather a reflection of the most common naturally occurring sanction combinations assigned by the courts. Based on the above taxonomy, five first-offender sanction combination groups are used in this analysis: 1) license suspension, 2) jail, 3) first offender treatment program plus jail, 4) first offender treatment program plus license restriction, and 5) SB 38 (second offender) treatment program plus license restriction (some courts assign this sanction to a small number of first offenders).

One limitation of the above hierarchical grouping scheme is that it does not allow for an evaluation of the independent and interactive effects of each sanction as a treatment factor. Taking first offender treatment program plus jail as an example, the approach we used does not allow analysis of the separate effects of jail from the effects of the treatment program.

A similar convention was used for grouping second offenders with various sanction combinations; the groups used in this analysis are: 1) license suspension, 2) SB 38 treatment program plus license restriction, 3) a group of 1992 and 1994 second offenders ("other") who did not meet the selection criteria of groups 1 or 2, and 4) a fourth group of 1994 second offenders who were ordered to install an ignition interlock device in their vehicles as mandated by AB 2851 (effective July, 1993). This device requires that the offender blow into it prior to starting the vehicle, which will not start if he/she has a BAC of 0.02% or greater. This group was identified by certain vehicle code designations on their abstract of conviction. In examining these abstract disposition codes, it was found that 88% of interlock cases were also referred to SB 38 treatment programs (along with license restrictions), while 38% had their licenses suspended (non-APS); of those that were suspended, 72% were assigned to SB 38 treatment programs. All second offenders who were assigned to install interlock are included in this evaluation, irrespective of other sanctions and regardless of actual installation. This is reflective of the "real world" conditions under which interlock is assigned and is an integral part of assessing the total impact of this sanction.

Most of the offenders in the group designated as "other" were originally referred to an SB 38 treatment program, but were suspended as well, either by intent (court sentence to both treatment program and suspension), or omission (court misreporting of disposition codes and/or the offender's lack of compliance with required procedures, such as failure to provide proof of insurance, program enrollment, pay fees, etc.). Even if the courts amend the mistaken abstracts of conviction, the offenders still need to meet the insurance and program enrollment requirements. The final sanctions ultimately received by this group are unclear, which makes interpretation difficult. The "other" group was not included in the first DUI-MIS 1989 arrest cohort analysis and, therefore, was not included in subsequent reanalyses of the 1989 arrestees.

Prior driver record data were extracted for the two years preceding an offender's DUI conviction date for all offenders. Appendix Tables B5, B6, and B7 list these prior driver record variables, which were used as covariates in the analyses. The evaluation period for the postconviction driving measures, starting from the conviction date, was six years for the 1989 drivers, three years for the 1992 drivers, and one year for the 1994 drivers. A buffer period of six months was allowed between the end of the evaluation period and the data extraction date to allow for processing and reporting the most recent data to DMV. DUI offenders who had less than the full follow-up time period (from conviction date to the buffer period) were excluded. The outcome driving record measures consisted of the proportion of offenders who were involved in: 1) total accidents and 2) DUI incidents (alcohol-involved accidents, major convictions, APS/refusal suspensions, or DUI failures to appear).

Evaluation Design and Analytical Procedures

Logistic regression analysis was used to evaluate the differences in the proportion of accident- and DUI-incident-involved drivers in each sanction group at the end of the evaluation period. Only the first accident or DUI incident or "failure" was evaluated. This is not an important limitation with these data because the incidence of repeat failures (two or more accidents or DUI incidents) was low over the study time window. More importantly, analysis of repeat failures would be subject to confounding by court sanctions received in connection with the first failure incident. This type of confounding is avoided because multiple incidents were not included in this analysis.

Since it was not possible to randomly assign drivers to the various sanction groups, potential biases due to preexisting group differences were statistically controlled by entering into the analyses as covariates biographical data, prior driving record data, and ZIP Code indices (accident and traffic conviction averages of each driver's ZIP Code area, and selected ZIP Code variables from the 1990 census data for the 1992 and 1994 drivers). (Tables B5, B6, and B7 show significant group differences on most of these variables.) While this "quasi-experimental" design is subject to a number of limitations in assessing cause-effect relationships, the statistical control of group differences removes at least part of the bias in group assignment and provides a more precise estimate of the relationship between type of sanction and subsequent record. It is likely, of course, that the groups also differ on characteristics not measured by, or reflected in, the covariates. The possibility of uncontrolled biases becomes particularly problematic if sanctions are commonly received by atypical offenders through self- or judicial-selectivity (e.g., drivers of higher socio-economic status might be more likely to receive program with restriction and less likely to receive jail than those of lower status).

In all of the analyses for accidents (except 1992 and 1994 second offenders) and DUI incidents for both first and second offenders in all three years, several significant ($p<.01$) covariate by sanction interactions were evident (statistical significance at $p<x$ means that a differential effect between groups would occur by chance less than x% of the time). These significant interactions indicated that the relationship between the covariates and the outcome measure varied across sanction groups, and therefore the covariates were included in the initial analyses for all three data sets to determine the magnitude of the interactions. In all analyses, except three (1989, 1992, and 1994 first offender subsequent accidents) where sanction differences were significant ($p<.03$), the interaction effect was generally one-fourth or less than the main effect of sanction (chi squares were divided by their respective degrees of freedom to provide an approximate measure of effect size). Since the sanction main effect had substantially greater magnitude than the interaction effects, conclusions about sanction differences were based on analyses that did not include the interactions. The interaction effects of the

remaining three analyses were examined and found not to create a serious impact on the sanction main effect.

Results of the First Offender Sanction Evaluation

Total Accidents: Figures 7, 8, and 9, and Table 14 display the results of the logistic regression analysis of total accidents for 1989, 1992, and 1994 first offenders. Among first offenders in all three years, the suspended group continued to have the significantly lowest proportion of accident-involved drivers relative to the other sanction groups, with 19.69 (1989), 10.27 (1992) and 3.52 (1994) accident involvements per 100 drivers (see Table 16 for a summary of significant results by sanction groups). These accident rates are 20%, 13.3%, and 18.5% lower than the next lowest group's rates (program with jail) for the three time periods, respectively. First offenders sentenced to jail-only had a significantly higher accident rate than that of most groups for all three years, except when compared to the SB 38 group in 1989, and in 1992 where significant differences in rates did not occur. (It should be noted that the jail-only sanction may actually be a less aversive punishment than other sanctions when community service is substituted for jail time, which is frequently the case.)

In all three year's analyses of first offenders on accidents, while there were fairly strong interactions between sanctions and covariates (age and prior minor convictions in 1989, age in 1992, and prior accidents in 1994), there still remained a strong main effect of sanction differences on accidents; the suspended group continued to have the lowest accident rates overall, while the jail-only group had the highest accident rates.

DUI Incidents: Figures 10, 11, and 12 and Tables 14 and 16 show that among the first offender groups in 1989, 1992, and 1994, the (statistically significant) lowest proportions of reoffending drivers were in the groups assigned to first-offender treatment program plus license restriction, with failure rates of 23.79, 12.35, and 4.51 per 100 drivers, respectively. This group had 12.6% and 13.1% fewer DUI incidents in 1989 and 1992, respectively, than the group with the next lowest recidivism rate (program with jail). In contrast, the highest recidivism rates occurred with the jail-only groups for all years (34.35, 21.94, and 9.01 for 1989, 1992, and 1994, respectively).

An overall trend in the decline of percentage differences in DUI incidents between the best group (first-offender treatment program plus restriction) and the next lowest group is evident over the years for the 1989 group. It would be expected that sanction differences between groups would diminish as the time window increases, particularly to a six-year period. Differences in failure proportions among the other three sanction groups were again not significant for the 1989 offenders, but were significantly different among the three groups in 1992 and 1994. The first offender treatment program with jail group in 1994 had lower recidivism rates than that of the SB 38 group, and lower

rates than that of the 1992 suspended group; however, the 1994 suspended group had significantly lower rates than the SB 38 group. Because of variations in the suspended group's rates, there is no totally consistent pattern in the DUI incident rates among these three groups over the three years. Overall, however, participation in the first-offender treatment program with license restriction continues to rank first in its effect on DUI incidents, while the jail-only sanction continues to have the least impact.

Results from the first offender sanction analyses on DUI incidents continue to replicate those from previous research studies for all three analyses. Sanction group differences on accidents in this year's analyses continued to be consistent for 1989, 1992, and 1994.

TABLE 14: FIRST OFFENDER SANCTION EFFECTS ON TOTAL ACCIDENTS AND DUI INCIDENTS BY YEAR

YEAR	SANCTION GROUP	SAMPLE SIZE	NUMBER OF ACCIDENT-INVOLVED, PER 100 DRIVERS	NUMBER OF DUI-INCIDENT-INVOLVED, PER 100 DRIVERS
1989	Suspension	(5,638)	19.69	27.85
(follow-up period = 6 years)	Jail	(7,199)	25.85	34.35
	1st DUI program & jail	(43,626)	24.57	27.23
	1st DUI program & license restriction	(41,223)	24.73	23.79
	SB 38 program & license restriction	(4,422)	24.67	27.40
1992	Suspension	(8,265)	10.27	15.95
(follow-up period = 3 years)	Jail	(4,769)	13.40	21.94
	1st DUI program & jail	(49,591)	11.84	14.20
	1st DUI program & license restriction	(32,476)	12.15	12.35
	SB 38 program & license restriction	(5,538)	12.04	14.58
1994	Suspension	(5,520)	3.52	4.78
(follow-up period = 1 year)	Jail	(3,825)	5.82	9.01
	1st DUI program & jail	(37,527)	4.32	5.25
	1st DUI program & license restriction	(26,945)	4.35	4.51
	SB 38 program & license restriction	(3,709)	4.67	6.88

Results of the Second Offender Sanction Evaluation

Total Accidents: Among the 1989 second offenders, license suspension continued to be significantly more effective than treatment program plus restriction in reducing total accident risk (see Figure 13, and Tables 15 and 16), six years subsequent to their convictions. The 1989 suspended group, with a failure rate (per 100 drivers) of 20.16, had 15.3% fewer accident-involved drivers than did the SB 38 program group. This finding is consistent with those of most prior studies of second offenders on total accidents. As noted below, the post 1989 cohorts show a different pattern.

Results of the 1992 and 1994 analyses (see Figures 14 and 15, Tables 15 and 16) were similar to those of the 1990, 1991, and 1992 one-year analyses (reported in the previous three DUI-MIS evaluations) in that significant differences were not evident among second offenders in their total accident rates. It has been noted in recent reports that since license suspension has been consistently effective in reducing accident risk, it was likely that the lack of significant group differences in the one-year period was due to the immediate short-term positive effect of the imposition of one-year APS license suspensions on all second offenders. It was found in the previous two analyses and in this year's analysis that the accident rates of the SB 38 participants have declined and were actually lower than those of the suspended group. Since the one-year follow-up period covers the time window when all second offenders are under APS suspension, it was reasoned that APS suspension would be expected to have a larger effect on the accident rates of previously nonsuspended SB 38 participants than it did on those who were suspended upon conviction. The data continue to support this interpretation.

In comparing accident rates between first and second offenders, Tables 14 and 15 show that, across all years, first offenders continue to experience higher accident rates than second offenders, a finding that has been apparent in previous DUI studies on accidents, even prior to DUI-MIS evaluations. As noted in recent DUI-MIS reports, the fact that second offenders have longer-term sanctions than do first offenders (18-month postconviction suspension or 18-month SB 38 treatment programs) may explain this difference.

DUI Incidents: Figures 13, 14, and 15 and Tables 15 and 16 show that in all three years, the suspended groups had significantly higher failure rates (by 18.1%, 45.0%, and 40.2% for 1989, 1992, and 1994, respectively) than corresponding rates for the SB 38 program participants. The much smaller difference (18.1%) between the two sanctions for the 1989 groups compared to the more recent cohorts on subsequent DUI incidents may also be attributable to the much longer (6 year) followup period. As noted in connection with first offenders, one would expect treatment effects to lessen with the passage of time.

The third group ("other") in the 1992 and 1994 analyses had failure rates midway between the other two groups. Failure rates of all three groups in 1992 were significantly different from each other. In the 1994 analysis, recidivism rates were significantly different between all groups except between the SB 38 program participants and the SB 38 program plus ignition interlock group; both groups had lower reoffense rates than the suspended or the "other" groups, and this finding was also evident in last year's 1993 one-year analysis. An additional analysis was conducted which included the same groups, but with the interlock group divided into those who were suspended and those who were not suspended (75% and 96% of those groups, respectively, were assigned to the SB 38 program plus license restriction). Although the results showed that the interlock group without suspension had the lowest reoffense rate, the results are somewhat limited by the fact that the number of cases for both groups remains insufficient, particularly in the presence of a nonrandom design, where self-selectivity and uncontrolled group biases may be influencing these results. A preferable approach to investigating the effectiveness of the interlock device would be a randomized design involving equivalent groups; such an effort is being considered in the foreseeable future, and may provide more clarification on the effect of interlock.

TABLE 15: SECOND OFFENDER SANCTION EFFECTS ON TOTAL ACCIDENTS AND DUI INCIDENTS BY YEAR

YEAR	SANCTION GROUP	SAMPLE SIZE	NUMBER OF ACCIDENT-INVOLVED, PER 100 DRIVERS	PERCENTAGE EFFECT (DIFFERENCE IN FAILURE RATES) $\frac{\text{GRP 1 - GRP 2}}{\text{GRP 2}} \times 100$	NUMBER OF DUI INCIDENT-INVOLVED, PER 100 DRIVERS	PERCENTAGE EFFECT (DIFFERENCE IN FAILURE RATES) $\frac{\text{GRP 1 - GRP 2}}{\text{GRP 2}} \times 100$
1989	1) Suspension	(9,482)	20.16		35.54	
(follow-up period = 6 years)	2) SB 38 program & license restriction	(23,927)	23.80	-15.3%	30.09	18.1%
1992	1) Suspension	(9,230)	9.12		15.31	
(follow-up period = 3 years)	2) SB 38 program & license restriction	(15,971)	9.80	-10.0%	10.56	45.0%
	3) Other	(10,170)	9.72		13.24	
1994	1) Suspension	(5,461)	3.24		8.27	
(follow-up period = 1 year)	2) SB 38 program & license restriction	(8,595)	2.82	14.9%	5.90	40.2%
	3) SB 38 program/ restriction interlock	(4,340)	2.85		5.60	
	4) Other	(7,273)	3.32		7.24

Note: A significant ($p < .03$ for 1st offenders and $p<.06$ for 2nd offenders) difference between sanction groups relative to the proportion of accident-involved or DUI incident-involved drivers is represented by an "S." The group number with the "S" indicates the group with the better (lower) rate. A nonsignificant difference is indicated by "ns." "na" means not applicable. Blanks appear in the lower half of each matrix, since the halves are identical.

Overall, findings for the 1989 second offenders on accidents replicate previous evaluations indicating that postconviction license suspension continues to be more effective than SB 38 treatment program plus restriction in reducing accidents over the 6-

year follow-up period. However, it should be recalled that these 1989 results pertain to a sanction structure that is quite different from the current one; there are now tougher requirements for insurance and program participation, lengthier suspension periods, more fees and the imposition of APS suspensions on all offenders.

Findings from the 1992 and 1994 second offender analyses were similar to previous post-APS one-year evaluations of second offenders in showing no evidence of significant differences between the sanction groups on subsequent accident rates. The fact that the 1-year accident rates for both the SB 38 treatment program participants and the interlock group were lower (14.9%) than that of the suspended group is likely attributable to the impact of APS suspensions. This is supported by the fact that this trend reverses (-10%) when more than a one-year time period is included. Because all second offenders since 1990 are suspended under APS for the duration of the one-year follow-up period, the differences between groups is more likely a measure of the incremental impact of alternative sanctions given in addition to suspension.

The results on reoffense rates for second offenders continue to be consistent with the findings of prior studies on alcohol-related incidents, indicating that SB 38 programs with license restriction are associated with a reduction in subsequent DUI incidents over all three follow-up periods.

<u>One-Year Recidivism Rates for First and Second Offenders from 1989-1994</u>

The one-year subsequent DUI-incident reoffense rates for both first and second offenders were compiled from the six annual DUI-MIS reports and configured onto a single graph to display these rates over time. Figure 16 shows the proportion of DUI offenders arrested each year between 1989 and 1994 who reoffended one-year after conviction. The DUI incidents include alcohol-involved accidents, major convictions (primarily DUI, reckless driving and hit-and-run), APS (0.08% BAC or chemical test refusal) suspensions (not included in the 1989 cases), and DUI failure-to-appear notices (FTA). Figure 16 shows a noticeable decline in the one-year recidivism rates of second offenders from 9.8% to 6.8% and for first offenders from 9.3% to 6.1% between 1989 and 1994. This decline translates into a 34.4% reduction for first offenders, and a 30.6% decrease for second offenders, in DUI incidents. Previous DUI-MIS reports have suggested that while many factors may be associated with this overall decline in DUI incidents, the reduction is likely attributable to the implementation of APS suspensions in 1990. Another DMV study, which is designed to investigate the specific deterrent

effects of the APS law, will be released soon and may present further information on the effectiveness of this law.

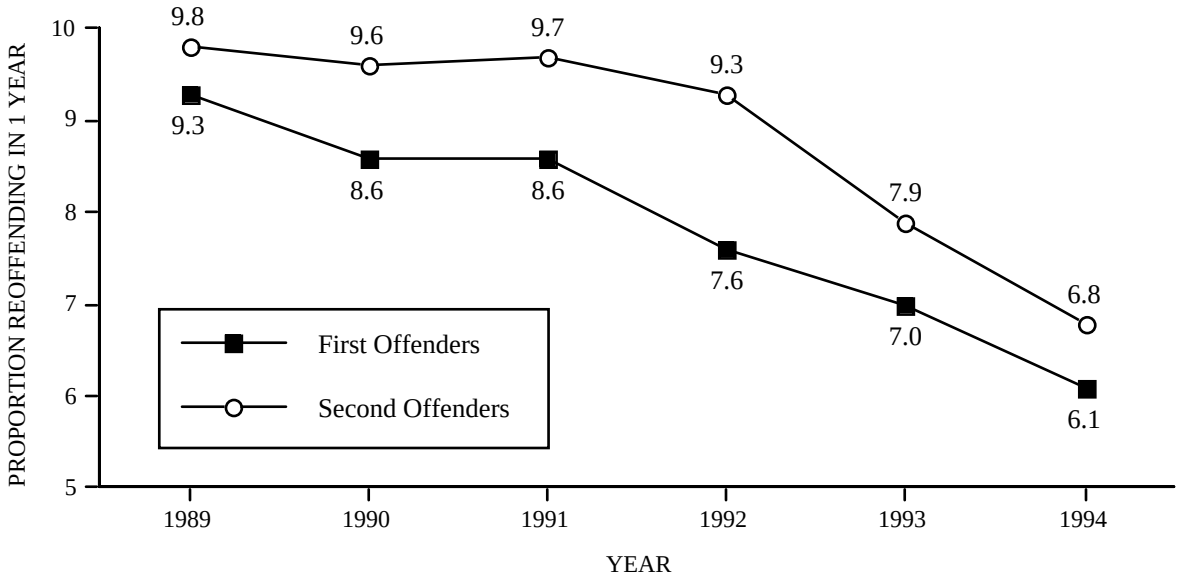

Figure 16 . Proportion of DUI offenders arrested in 1989-1994 reoffending (DUI incidents) one-year after conviction.

SECTION 5: ADMINISTRATIVE ACTIONS

Data on DMV administrative license disqualification actions (license suspension or revocation––S/R) taken in DUI cases are presented below. These statutorily mandated actions are initiated by the receipt of either a law enforcement APS report (.08% BAC, zero tolerance, or chemical test refusal) or court abstract of conviction. It should be noted that multiple actions can result from a single DUI incident––for example, a single DUI arrest frequently will result in both an APS suspension and a mandatory postconviction suspension action. This section includes the following tables and figure:

Table 17: Mandatory DUI License Disqualification Actions, 1985-1995. This table shows preconviction (APS) and postconviction license disqualification totals from 1985 through 1995. The postconviction totals include juvenile suspensions, first-offender suspensions, second-offender suspensions and revocations, and third- and fourth-offender revocations.

Table 18: Administrative Per Se Process Measures. This table presents APS process measure data for fiscal years 93/94 through 95/96.

Figure 17 graphically portrays mandatory DUI license disqualification totals from 1985 through 1995.

The following statements are based on the data shown in Tables 17-18 and Figure 17.

- During 1991, the first full calendar year of APS license suspension, the total number of DMV DUI suspension/revocation actions increased by 60% over 1990. Each year since then these numbers have declined, by an overall 38%, mirroring the 36% decline in DUI arrests over the same period.

- In 1995, 179,492 APS license actions were taken. Of these actions, 71% were first-offender actions and 29% were repeat-offender actions.

- In FY 95/96, APS actions increased by 10.7%, breaking the recent consistent downward trend in DUI arrests and APS actions.

- Chemical test refusal actions have steadily continued to decline, and have decreased by 58% since 1985.

- The number of mandatory postconviction license actions decreased by 12% in 1995, and has dropped virtually in half since 1991.

- Since APS was implemented in July 1990, over 1 million (1,383,175) APS suspension or revocation actions had been taken through June 1996.

- During the first five years of APS implementation, requests for hearings increased each year, rising from 6.8% of all APS actions in FY 90/91 to 11.8% in 94/95. In 95/96 this trend stopped, with requests for hearing dropping 27% to 8.6% of all APS actions. The rate at which APS suspension/revocation actions are upheld after hearing continued to decline, however, dropping to only 68% in 95/96, compared to 80% in 94/95.

- During the first 30 months after implementation (on January 1, 1994) of the "zero tolerance" law for minors, 23,465 suspension actions were taken.

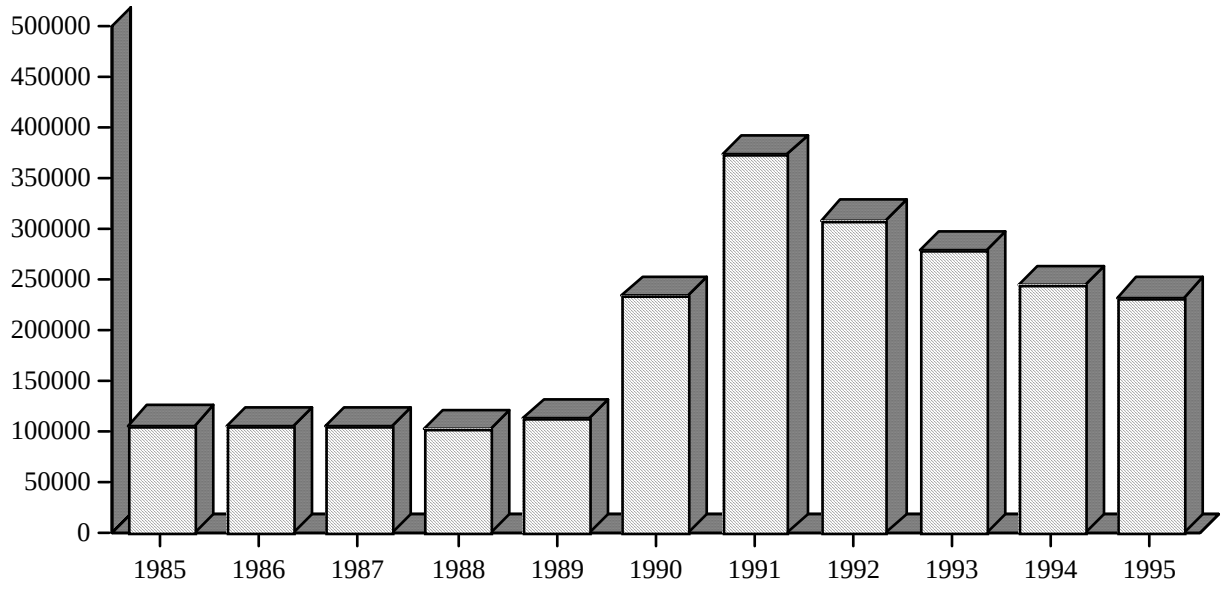

Figure 17 . Mandatory DUI license disqualification actions, 1985-1995.

.08 APS refusal actions sustained or upheld following a hearing	1,758*	1,326	1,108

*Figures corrected.

[1].08 refers to APS actions taken subsequent to obtaining evidence of a BAC equal to or in excess of the .08% per se level. Such an action is taken in conjunction with a DUI arrest.

[2].01 refers to APS suspensions taken against drivers under the age of 21 with BACs in excess of .01%, or on the basis of a chemical test refusal, and are not necessarily taken in conjunction with a DUI arrest.

[3]All entries in this category exclude actions later set aside but, where possible, include actions taken on the basis of either a chemical test refusal or a BAC test result. This category does not include .01 actions, which are not varied by offender status or occupation.

[4]Prior DUI convictions consist of any such conviction where the violation occurred within the seven years prior to the current violation.

[5]Introduced 1/1/95 this restriction allows driving to, from, and during the course-of-employment.

[6]This figure excludes subsequent APS dismissal hearings and departmental review hearings or procedures. Both numerator and denominator include those actions later set aside as a result of the hearing.

SECTION 6: ACCIDENTS INVOLVING ALCOHOL

This section presents data on alcohol-involved accidents, as compiled and reported by the California Highway Patrol, as well as accident data which have been crosstabulated with Department of Justice DUI arrest data. Drivers identified as being under the influence of drugs other than alcohol are also included in the "alcohol-involved accident" category, but typically comprise less than 1% of the total (only 3 total cases for 1994 data). This section includes the following tables:

Table 19: Race/Ethnicity by Sobriety Code of Accident-Involved 1994 DUI Arrestees. This table shows the law enforcement officer's determination of sobriety for accident-involved 1994 DUI arrestees, by race/ethnicity.

Table 20: Fatal and Injury Accidents of 1994 DUI Arrestees by Race/Ethnicity and Type of Arrest. This table portrays the fatal/injury accident involvement of DUI arrestees, by race/ethnicity and type of arrest (felony, juvenile, or misdemeanor).

Table 21: Adjudication Status by Sobriety Code for Accident-Involved 1994 DUI Arrestees. This table crosstabulates accident sobriety codes (from law enforcement accident reports) with the court disposition of the 1994 DUI arrests associated with those accidents.

Table 22: Fatal and Injury Accidents of 1994 DUI Arrestees by Type of Arrest and Adjudication Status. This table displays the adjudication status of fatal and injury accident-involved 1994 DUI arrestees, by type of arrest.

Table 23: 1994 Accident-Involved DUI Arrestees With No Record of Conviction, by County and Type of Arrest. This table shows the number of accident-involved 1994 DUI arrestees without a corresponding recorded conviction, by type of DUI arrest, by county.

Table 24: 1-, 3-, and 6-Year Total, Fatal/Injury, and Alcohol-Related Accident Means by Offender Status. This table shows the average number of total, fatal/injury, and alcohol-related accidents for 1994, 1992, and 1989 DUI arrestees for time periods of 1, 3, and 6 years subsequent to their arrests, respectively, by offender status (number of prior offenses).

Figure 18 (below) shows the annual percentages of traffic injuries and fatalities that were alcohol-involved from 1985 to 1995. The numerical data for this graph are shown on the DUI summary statistics sheet at the beginning of this report.

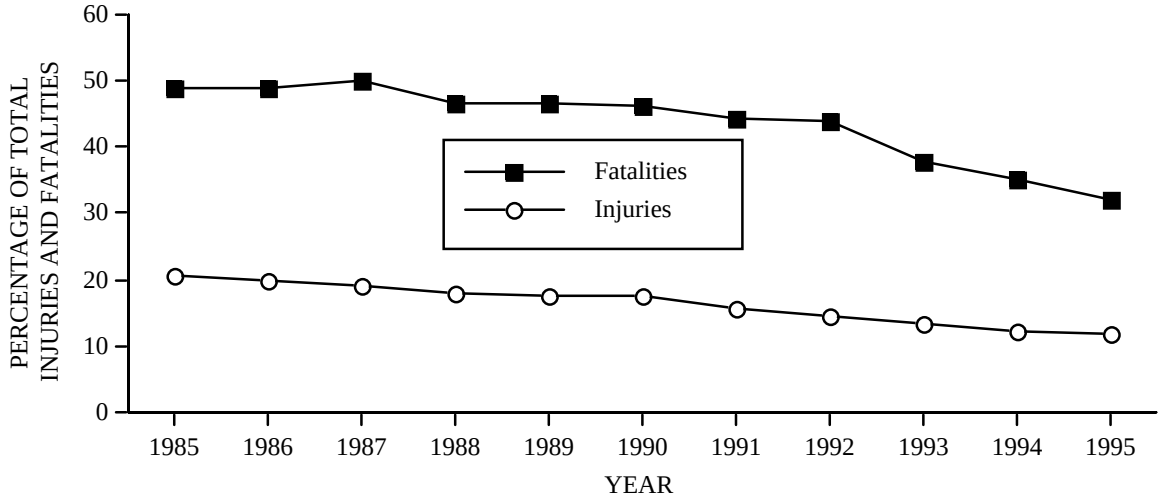

Figure 18 . Percentage of total injuries and total fatalities that were alcohol-involved, 1985-1995.

Based on these data, the following statements can be made:

- The number of alcohol-involved traffic fatalities decreased by 9.7% in 1995, and has declined by over half (51%) since 1987. The proportion of fatalities which are alcohol-involved declined from 50.1% in 1987 to 32.2% in 1995.

- The proportion of traffic accident injuries that are alcohol-involved has also declined each year since 1987. Alcohol-involved injuries dropped 6.3% during 1995 and 46.3% from 1987 to 1995.

- 13.2% of all 1994 DUI arrests were associated with a reported traffic accident, compared to 13.1% in 1993 and 11.1% in 1992 and 1991. 49.5% of these accidents involved an injury or fatality.

- In 25% of cases where a DUI offender was arrested in connection with a reported traffic accident, there is no record of any corresponding conviction. In 91.5% of

these nonconvicted cases, the accident report indicated that the drivers had been drinking and that their ability was impaired.

- Of all 1994 accident-involved DUI arrestees with no record of conviction, 17.9% had been arrested for felony DUI, down from 18.5% in 1993, 19.0% in 1992, and 19.4% in 1991.

- 6.5% (13,632) of 1994 DUI arrests were associated with a fatal or injury accident, up from 6.4% the previous year. Of these fatal/injury accidents, only 29.6% (4,031) led to an arrest for felony DUI, and only 10% (1,371) led to a conviction of felony DUI. Over 27% (3,704) of DUI arrests stemming from a fatal/injury accident did not result in a reported conviction.

- The fatal/injury and total accident risk of DUI offenders generally decreases with the number of prior DUI convictions for periods up to five years after arrest, while, conversely, the risk of involvement in an alcohol-related accident generally increases with number of priors over the same time periods. This is not surprising because as the number of prior DUIs increases, the time period of the suspension/revocation lengthens, and prior research has demonstrated that suspension/revocation has a larger impact on reducing non-DUI accidents than DUI accidents.

TABLE 19: RACE/ETHNICITY BY SOBRIETY CODE OF ACCIDENT-INVOLVED 1994 DUI ARRESTEES*

DATA SOURCES AND LIMITATIONS

DUI Arrest Data:
Arrest data are reported to the Department of Justice (DOJ), Law Enforcement Information Center, by individual law enforcement agencies throughout the state. As such, these data are subject to reporting errors such as incorrect names, birthdates or arrest dates. Nonreporting of arrest data due to error or omission can also occur; for example, in 1995 the Oakland Police Department reported no DUI arrests, after reporting 960 such arrests in 1994. In addition, when data are entered into DOJ's Monthly Arrest and Citation Register (MACR) system, only the highest-order offense is included. Therefore, in cases where a DUI arrest is made in conjunction with, for example, an auto theft arrest, that DUI arrest will not be included in the database. This results in a slight but systematic underreporting of the number of DUI arrests annually.

DUI Conviction Data:
Abstracts of conviction for DUI and other traffic-related offenses are reported to the DMV by courts throughout the state. As abstracts are received (either hard copy, magnetic tape or through direct electronic access from the courts) they are entered onto the DMV driver record database. Abstracts without an identifying driver license number are run through the automated name index (ANI) system in order to match the abstract with an existing driver record; in cases where no such match can be made, an "X" numbered record is created to store the abstract. The total number of DUI abstracts of conviction received by DMV from the courts is tallied monthly and annually. Since this workload total includes abstracts which amend, correct or dismiss prior abstracts of conviction, it tends to overestimate the actual number of convictions which have occurred. Conviction data are also subject to reporting and nonreporting errors similar to those for DUI arrests. For example, the 1993 Annual Report of the California DUI Management Information System documented that thousands of DUI convictions showing in court records do not appear on the DMV driver record database.

Alcohol-Involved Accident Data:
Accident data are reported to the California Highway Patrol (CHP) by local law enforcement agencies and district offices of the CHP. As such, these data are subject to reporting and nonreporting errors similar to those occurring in both DUI arrest and conviction data. While most local law enforcement agencies will investigate and file reports on accidents involving injury or death, the investigation and reporting of property-damage-only accidents varies widely by local jurisdiction. Data are entered onto CHP's Statewide Integrated Traffic Records System (SWITRS) and output in annual published reports.

GLOSSARY

ADMINISTRATIVE PER SE (APS)

Administrative per se ("on-the-spot") license suspension or revocation occurs immediately pursuant to lawful arrest of a person driving with a blood alcohol concentration (BAC) of 0.08% or more, or one who refuses a chemical test. Upon arrest, the driver's license is immediately confiscated by the law enforcement officer and an order of suspension or revocation served. The driver is issued a temporary license and allowed due process through administrative review. In July 1990, California became the 28th state to implement APS. In January 1994, California enacted a "zero tolerance" statute which requires the administrative suspension of any driver under age 21 with a BAC of 0.01% or greater, or who refuses to be tested.

ALCOHOL-INVOLVED ACCIDENT

Alcohol-involved accidents are those in which the investigating law enforcement officer indicates on the accident report that the driver "had been drinking (HBD)." Accidents involving drivers who are determined to be under the influence of drugs other than alcohol (typically less than 1% of all accidents) are also included in the alcohol-involved accident category.

ALCOHOL-RELATED RECKLESS DRIVING

Commonly called a "wet" reckless, alcohol-related reckless driving refers to an arrest/conviction incident which originated as a DUI arrest. DUI arrests involving drugs which are reduced to reckless driving are also referred to as alcohol-involved or "wet" reckless driving. "Wet" reckless convictions count as priors for the purposes of enhanced penalties upon subsequent conviction of DUI.

ALPHA

Alpha is the investigator's acceptable risk or probability level of making a Type 1 error (generally chosen to be small–e.g., 1% or .01, 5% or .05). There is always some risk of a Type 1 error, so alpha cannot be zero. Alpha is also called the significance level, because it is the criterion for claiming statistical significance.

BAC

Blood alcohol concentration, or BAC, is a measure of the percent, by weight, of alcohol in a person's blood. Statutorily, BAC is based upon grams of alcohol per 100 milliliters of blood or per 210 liters of breath.

CONVICTION

Conviction of an offense, as used in this report, refers to the receipt by DMV of a court abstract of conviction. In a small proportion of cases, an offender may be

convicted of an offense but that conviction is not reported to DMV. Such cases would functionally be treated by DMV as though the offender had not been convicted. Because convictions can be amended, corrected, dismissed or simply not reported at all, the conviction totals reported herein are dynamic and subject to change.

COVARIATE

A variable used to statistically adjust the results of an analysis for differences (on that variable) existing among subjects prior to the comparison of treatment effects.

DUI

DUI is an acronym for "driving under the influence" of alcohol and/or drugs, a violation of Sections 23152 or 23153 of the California Vehicle Code.

LOGISTIC REGRESSION

Logistic regression analysis is a statistical procedure evaluating the linear relationship between various factors and the occurrence or nonoccurrence of an outcome event. In this study, the procedure was used to explain the relationship between the various sanctions and the proportion of DUI offenders who incurred accidents and/or DUI incidents.

MAJOR CONVICTION

Major convictions include primarily DUI convictions, but also reckless driving and hit-and-run convictions.

p

p stands for probability. For example, if $p<.05$, the probability is less than 5 chances in 100 that the difference you found is by chance alone.

QUASI-EXPERIMENTAL DESIGNS

Quasi-experimental designs refer to analyses where the comparison groups are not equivalent on characteristics other than the treatment conditions because random assignment was not used. Caution should be exercised when interpreting the results because of possible confounding of group bias with treatment effects. Covariates are used to statistically reduce group differences prior to the comparison of treatment effects.

SIGNIFICANT (STATISTICALLY)

If the result of a statistical test is significant, this means that the difference found is very unlikely by chance alone. How unlikely is determined by alpha.

APPENDIX A

Assembly Bill No. 757

CHAPTER 450

An act to add Section 1821 to the Vehicle Code. relating to driving offenses.

(Approved by Governor September 14, 1989. Filed with Secretary of State September 15, 1989.)

LEGISLATIVE COUNSEL'S DIGEST

AB 757, Friedman. Driving offenses: intervention programs: evaluation.

Under existing law, the Department of Motor Vehicles maintains records of driver's offenses reported by the courts. Including violations of the prohibitions against driving while under the influence of an alcoholic beverage, any drug, or both, driving with an excessive blood-alcohol concentration, or driving while addicted to any drug.

This bill would, additionally, require the department to establish and maintain a data and monitoring system, as specified, to evaluate the efficacy of intervention programs for persons convicted of those violations relating to alcohol and drugs, and to report thereon annually to the Legislature.

The bill would declare legislative findings.

The people of the State of California do enact as follows:

SECTION 1. The Legislature finds and declares as follows:

(a) Drivers under the influence of drugs or alcohol continue to present a grave danger to the citizens of this state.

(b) The Legislature has taken stern action to deter this crime and punish its offenders and has provided a range of sanctions available to the courts to use at their discretion.

(c) No system exists to monitor and evaluate the efficacy of these measures or to determine the achievement of the Legislature's goals.

(d) This lack of accurate and up-to-date comprehensive statistics hampers the ability of the Legislature to make informed and timely policy decisions.

(e) It is essential that the Legislature acquire this information, from available resources, as soon as practicable, and that this information be updated and transmitted annually to the Legislature.

SEC. 2. Section 1821 is added to the Vehicle Code, to read:

1821: The department shall establish and maintain a data and monitoring system to evaluate the efficacy of intervention programs for persons convicted of violations of Section 23152 or 23153.

The system may include a recidivism tracking system. The recidivism tracking system may include, but not be limited to, jail sentencing, license restriction, license suspension. Level I (first offender) and II (multiple offender) alcohol and drug education and treatment program assignment, alcohol and drug education treatment program readmission and dropout rates, adjudicating court, length of jail term, actual jail or alternative sentence served, type of treatment program assigned, actual program compliance status, subsequent accidents related to driving under the influence of alcohol or drugs, and subsequent convictions of violations of Section 23152 or 23153.

The department shall submit an annual report of its evaluations to the Legislature. The evaluations shall include a ranking of the relative efficacy of criminal penalties, other sanctions, and intervention programs and the various combinations thereof.
